

in 1833 Bonneville searched for and found the "Great Tar Spring" in the neighborhood of the Popo Agie. His men used the oil for the galled backs of their horses and for their own aches and pains. There is some dispute as to the exact location of these "tar springs" but Geologist Wilbur C. Knight identifies the Popo Agie Field as being the same as what is now known as the Dallas Dome field within the Brunot lands. Knight reports that this field remained unknown except to the hunter and trapper until 1867. Upon completion of the Union Pacific people became interested and the property changed hands several times prior to 1880 but there was no development except pits sunk as assessment holes. Knight reports one Graff purchased the property in 1881 and in 1883 and 1884 drilled three oil wells. The oil was placed in iron barrels and marketed at the Union Pacific Railroad but this commercial venture failed because of the keen competition of eastern oil producers. Knight reports the wells were then packed and remained so until the time of his report (1897). He also reported that oil flowing from leaks was utilized by ranchers for lubricating purposes and to some extent by the gold mines and the flour mill. Knight locates these wells as being on the Little Popo Agie river, ten miles southeast of Lander, at that time over 100 miles from any railroad. Knight stated the development of the oil fields in the area depended entirely upon the construction of a railroad into the section to furnish transportation.

Drilling resumed in the Dallas Dome oil field in 1901, and one well was completed in that year, two in 1902 and three in 1903. There is no data available as to the quantity of oil produced in the early life of the
